

Lecture #5

- Last time: cross product.

• Allowed us to build perpendicular vectors to 2 given vectors.

• Example:

$$\vec{u} = \langle 7, -1, 3 \rangle, \quad \vec{v} = \langle -4, 9, 6 \rangle$$

$$\vec{u} \times \vec{v} = \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ 7 & -1 & 3 \\ -4 & 9 & 6 \end{vmatrix}$$

$$= \begin{vmatrix} -1 & 3 \\ 9 & 6 \end{vmatrix} (\vec{i}) - \begin{vmatrix} 7 & 3 \\ -4 & 6 \end{vmatrix} (\vec{j}) + \begin{vmatrix} 7 & -1 \\ -4 & 9 \end{vmatrix} (\vec{k})$$

$$= [(-1)(6) - (3)(9)](\vec{i}) - [(7)(6) - (-4)(3)](\vec{j})$$

$$+ [(7)(9) - (-4)(-1)](\vec{k})$$

$$= -33(\vec{i}) - 54(\vec{j}) + 59(\vec{k})$$

$$= \langle -33, -54, 59 \rangle$$

- Recall: proposition (Properties of the \times product)

• let $\vec{u}, \vec{v}, \vec{w} \in \mathbb{R}^3$ and $c \in \mathbb{R}$

Algebraic
Properties

$$\textcircled{1} \vec{u} \times \vec{v} = -\vec{v} \times \vec{u}$$

$$\textcircled{2} (c\vec{u}) \times \vec{v} = c(\vec{u} \times \vec{v}) = \vec{u} \times (c\vec{v})$$

$$\textcircled{3} \vec{u} \times (\vec{v} + \vec{w}) = (\vec{u} \times \vec{v}) + (\vec{u} \times \vec{w})$$

$$\textcircled{4} (\vec{u} + \vec{v}) \times \vec{w} = (\vec{u} \times \vec{w}) + (\vec{v} \times \vec{w})$$

$$\textcircled{5} \vec{u} \cdot (\vec{v} \times \vec{w}) = (\vec{u} \times \vec{v}) \cdot \vec{w}$$

$$\textcircled{6} \vec{u} \times (\vec{v} \times \vec{w}) = (\vec{u} \cdot \vec{w})\vec{v} - (\vec{u} \cdot \vec{v})\vec{w}$$

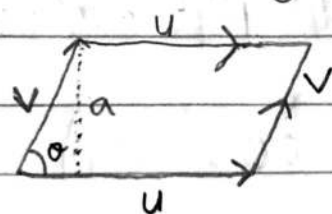

- (Properties of \times product cont.)

Geometric Properties

- ⑦ $\vec{u} \times \vec{v}$ is orthogonal to both \vec{u} and \vec{v}
- ⑧ $|\vec{u} \times \vec{v}| = |\vec{u}| |\vec{v}| \sin(\theta)$, where θ is the angle between \vec{u} and \vec{v}
- ⑨ $\vec{u} \times \vec{v} = \vec{0}$ iff \vec{u} and \vec{v} are parallel

- NB: The cross product obeys the right hand rule.

• As for the magnitude,

Note that θ has $\sin(\theta) = \frac{a}{|\vec{v}|} \rightarrow a = |\vec{v}| \sin \theta$

\therefore Area of parallelogram

$$A = (\text{altitude})(\text{base}) = a |\vec{u}| = |\vec{u}| |\vec{v}| \sin \theta$$

• Main point: the area of parallelogram formed by \vec{u} and \vec{v} is the magnitude of the cross product.

- Proof of part 8 of the proposition: we compute as follows

$$|\vec{u} \times \vec{v}|^2 = (\vec{u} \times \vec{v}) \cdot (\vec{u} \times \vec{v}) \quad (\text{property of dot product})$$

Pretend this is \vec{w} , then apply part 5.

$$= \vec{u} \cdot (\vec{v} \times (\vec{u} \times \vec{v})) \quad \text{apply property 6}$$

$$= \vec{u} \cdot ((\vec{v} \cdot \vec{v})\vec{u} - (\vec{v} \cdot \vec{u})\vec{v})$$

- proof cont.

$$\begin{aligned} &= \vec{u} \cdot (\vec{v} \cdot \vec{v} \vec{u}) - \vec{u} \cdot (\vec{v} \cdot \vec{u} \vec{v}) \\ &= (\vec{v} \cdot \vec{v})(\vec{u} \cdot \vec{u}) - (\vec{v} \cdot \vec{u})(\vec{u} \cdot \vec{v}) \\ &= |\vec{v}|^2 |\vec{u}|^2 - (\vec{u} \cdot \vec{v})^2 \end{aligned} \left. \begin{array}{l} \\ \\ \end{array} \right\} \begin{array}{l} \text{from} \\ \text{Properties} \\ \text{of dot} \end{array}$$

$$= |\vec{u}|^2 |\vec{v}|^2 - (|\vec{u}| |\vec{v}| \cos(\theta))^2 \quad \begin{array}{l} \text{from geometric} \\ \text{interpretation} \\ \text{of dot product} \end{array}$$

$$= |\vec{u}|^2 |\vec{v}|^2 - |\vec{u}|^2 |\vec{v}|^2 \cos^2(\theta)$$

$$= |\vec{u}|^2 |\vec{v}|^2 (1 - \cos^2(\theta))$$

$$= |\vec{u}|^2 |\vec{v}|^2 \sin^2(\theta)$$

$$= (|\vec{u}| |\vec{v}| \sin(\theta))^2$$

$$\therefore (|\vec{u}| \times |\vec{v}|)^2 = (|\vec{u}| |\vec{v}| \sin(\theta))^2$$

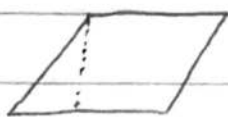

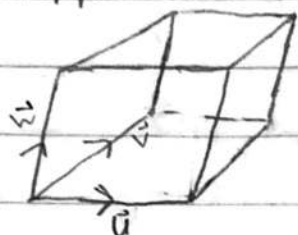

• On the other hand, θ is the geometric angle between \vec{u} and \vec{v}

$\therefore \theta$ can be expressed as $\theta \in [0, \pi]$

So $\sin(\theta) \geq 0$, Hence

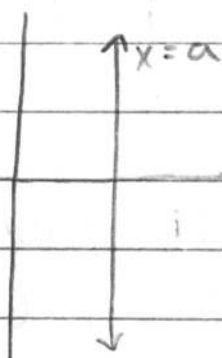

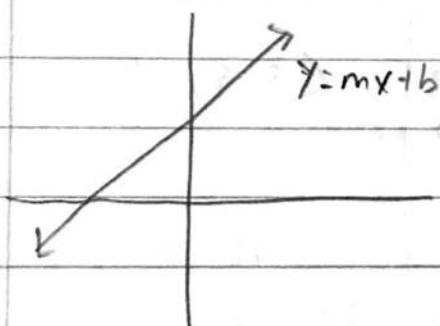

$|\vec{u} \times \vec{v}| = |\vec{u}| |\vec{v}| \sin(\theta)$ as desired.

(Cor: The Scalar triple product $\vec{u} \cdot (\vec{v} \times \vec{w})$ computes the Signed volume of the parallelepiped determined by $\vec{u}, \vec{v}, \vec{w}$

§ 12.5: Lines and planes

In 2-space

$$ax + by = c$$

$$\vec{n} \cdot \langle x, y \rangle = c$$

$$(\vec{n} \neq \vec{0})$$

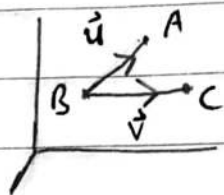

In 3-space, examine $\vec{n} \cdot \vec{x} = d = \langle a, b, c \rangle \cdot \langle x, y, z \rangle$

$$\rightarrow = ax + by + cz = d$$

This is a plane in 3-space

NB: Given 2 vectors, (both non-parallel), we get a plane. One normal vector to that plane is the cross product of the given vectors.

- Example: compute an equation of the plane containing the points:
 $(0, 1, 3)$; $(2, 4, 0)$; $(1, 2, 3)$

Solution: note that the vectors

$$\vec{u} = \langle 2-0, 4-1, 0-3 \rangle = \langle 2, 3, -3 \rangle$$

$$\vec{v} = \langle 1-0, 2-1, 3-3 \rangle = \langle 1, 1, 0 \rangle$$

• we can use a normal vector

$$\vec{n} = \vec{u} \times \vec{v} = \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ 2 & 3 & -3 \\ 1 & 1 & 0 \end{vmatrix} = \langle 3, -3, -1 \rangle$$

\therefore the plane has equation $\vec{n} \cdot \vec{x} = d$

using $(0, 1, 3)$ and $3x - 3y - z = d$

we determine $d = 3 \cdot 0 - 3 \cdot 1 - 3 = -6$

\therefore the plane has equation $3x - 3y - z = -6$
